

“Buy limit” signal misclassified as “delete pendings” command

Incident report · TScopier signal parsing pipeline · 2026-09-19

SEVERITY	Low	STATUS	Fixed — pending order routing + TP parsing + translations
DATES	Signal received 2026-09-18 15:04 UTC; fix 2026-09-19	AFFECTED	1 user — k.eloifabien@gmail.com (ce0fc42d-...bd6be)
COMPONENT	parseSignal.ts , executionShape.ts , helpers.ts	ROOT CAUSE	AI misclassified “buy limit” as cancel command; missing entry_order_type field; TP @-separator not supported

1. Executive summary (plain English)

A user sent a message to the “Lorax Layer VIP” channel that said “XAUUSD buy limit@4347.520” with stop loss and take profit levels. The copier’s AI read this message and incorrectly decided it was a command to cancel pending orders, instead of recognizing it as a new buy limit order that should be placed on the broker.

Because the message was sent as a reply to another Telegram message, the copier tried to find the original trade being referenced. But the replied-to message was never a signal the copier had seen before, so it had no idea what trade to cancel. The copier then showed the user a raw internal code “delete pendings no parent” instead of a helpful error message.

We fixed this by pulling in Emmanuel’s pending order routing fix, which adds proper recognition of explicit “buy limit” and “buy stop” wording. We also fixed a separate issue where take-profit values using the @ symbol (like “Tp1@4357”) were not being parsed correctly, and added missing translations for the error message across all supported languages.

2. Issue encountered

- At 2026-09-18 15:04:48 UTC, user sent this message in the “Lorax Layer VIP” channel as a reply to Telegram message 62159 :
XAUUSD buy limit@4347.520
Sl@4337
Tp1@4357
Tp2@4375
- The AI pipeline classified the intent as cancel_pending (confidence 85%) — it interpreted this as “cancel my pending orders for XAUUSD.”
- The copier recognized it as a reply-scoped management instruction and tried to find the parent signal.
- Message 62159 was not found in the signals table or channel_messages table — it was never a signal the copier had parsed.
- The copier skipped the instruction with reason delete_pendings_no_parent .
- The user saw the raw internal code “delete pendings no parent” instead of a helpful message.

3. Affected user(s)

USER (EMAIL)	SUPABASE ID	CREATED (UTC)	CHANNEL	TRADES
k.eloifabien@gmail.com	ce0fc42d-...bd6be	2026-08-25 19:45	Lorax Layer VIP	0 on this channel; 2 open sells on other channels

No trades were affected — the signal was skipped entirely. The user has 2 open sell positions on gold from other channels (GtMax F&F, TRADING LIFE, DAVO ELITE CLUB, etc.), but none from “Lorax Layer VIP.”

4. Root cause

- AI misclassified the intent.** The message “XAUUSD buy limit@4347.520” was clearly a new entry order, but the AI pipeline classified it as cancel_pending (85% confidence). This is a classification error in the signal parsing pipeline.
- Missing entry_order_type field.** Before Emmanuel’s fix, the copier did not recognize explicit “BUY LIMIT” or “BUY STOP” wording. The message was parsed as a plain buy with an entry price, which the AI then misinterpreted as a cancel command when combined with the reply context.
- No parent signal found.** The copier tried to find the original trade referenced by the reply (message 62159), but that message was never a signal in the copier’s database. The copier gave up entirely instead of attempting to place the trade.
- Missing translation.** The skip reason delete_pendings_no_parent had no user-facing label in any locale, so the fallback at channelWorkerLogMessage.ts:275 just converted underscores to spaces.
- TP parsing did not support @ symbol.** The regex patterns for parsing take-profit values used [:=\-\s] as separators but did not include @ . Messages like “Tp1@4357” were not parsed correctly.

5. The fix

- Emmanuel’s pending order routing fix** (cherry-picked from fd4b1750 and 28f59e79):
 - Adds entry_order_type: 'market' | 'limit' | 'stop' | null to parsed signals.
 - Explicit “BUY LIMIT” and “BUY STOP” wording is now preserved in the parser.
 - The copier routes explicit pending order operations directly to BuyLimit , SellLimit , BuyStop , or SellStop instead of converting them to market orders or misclassifying them.
- TP @-separator fix** (worker/src/parseSignal.ts):
 - Added @ to the regex character class [:=\-\s] in TP parsing patterns.
 - Messages like “Tp1@4357” are now correctly parsed as take-profit levels.
- Missing translations** (all 9 locale files + copierSkipReasonLabels.ts):
 - Added delete_pendings_no_parent , delete_pendings_requires_reply , and delete_pendings_none to all locale files.
 - Added labels and detailed explanations to COPIER_SKIP_REASON_LABELS and COPIER_SKIP_REASON_DETAILS .

6. Files changed

- worker/src/explicitPendingOrder.test.ts — **new** test file for explicit pending order parsing and routing.
- worker/src/manualPlanning/executionShape.ts — added explicitEntryOrderType parameter; explicit pending orders bypass legacy market/strict-entry coercion.
- worker/src/manualPlanning/planManualOrders.ts — passes explicitEntryOrderType to resolveOpExecAndStrict .
- worker/src/manualPlanning/types.ts — added EntryOrderType type and entry_order_type field to ParsedSignal .
- worker/src/parseSignal.ts — added applyExplicitEntryOrderType function; added @ to TP parsing regex patterns.
- worker/src/tradeExecutor/entryPrepare.ts — passes entry_order_type through the planning pipeline.
- worker/src/tradeExecutor/helpers.ts — operationFor now maps explicit entry_order_type to correct broker operations.
- src/i18n/channelWorker/en.ts — added delete_pendings_no_parent , delete_pendings_requires_reply , delete_pendings_none .

- `src/i18n/channelWorker/fr.ts` — French translations.
- `src/i18n/channelWorker/es.ts` — Spanish translations.
- `src/i18n/channelWorker/ar.ts` — Arabic translations.
- `src/i18n/channelWorker/ja.ts` — Japanese translations.
- `src/i18n/channelWorker/nl.ts` — Dutch translations.
- `src/i18n/channelWorker/pl.ts` — Polish translations.
- `src/i18n/channelWorker/ru.ts` — Russian translations.
- `src/i18n/channelWorker/sv.ts` — Swedish translations.
- `src/lib/copierSkipReasonLabels.ts` — added labels and details for `delete_pendings_*` skip reasons.
- `docs/PROJECT_MEMORY-EMMA.md` — Emmanuel's project memory entry for the explicit pending order fix.

7. Verification

- Confirmed against production DB: `signals` table shows the skipped signal `bb6b1b85` with `parent_signal_id: null` and `skip_reason: delete_pendings_no_parent`.
- Confirmed the replied-to message `62159` does not exist in `signals` or `channel_messages` — it was never a signal the copier had parsed.
- Parser test: “XAUUSD buy limit@4347.520\nSl@4337\nTp1@4357\nTp2@4375” now correctly parses with `entry_order_type: limit` and `tp: [4357, 4375]`.
- All 3 explicit pending order tests pass.
- Worker typecheck (`npm run tsc --noEmit`) passes.

8. Deployment status

- **Code:** cherry-picked to the `migration` branch and staged. Not yet committed or deployed.
- **Pending:** commit, push to staging, deploy to production worker.

9. Follow-ups

- Investigate why the AI pipeline misclassified “XAUUSD buy limit” as a `cancel_pending` intent. The message format is clearly a new entry, not a cancel command. The classification confidence was 85%, which suggests a systematic issue with how the AI distinguishes between entry orders and cancel commands.
- Deploy the fix to staging and production.
- Consider adding a more robust fallback: if a management instruction fails to find a parent signal, surface a clear user-facing message instead of a raw code.
