

Contabo VPS Setup

Contabo VPS — Request for Server Creation

Purpose: Please create the server below and send back the access details. The team lead will handle all software installation and configuration.

What to order

Go to **contabo.com** and order:

Setting	Value
Product	Cloud VPS 4
CPU	4 vCPU
RAM	8 GB
Storage	100 GB SSD
Traffic	Unlimited
Operating system	Ubuntu 22.04
Datacenter	US East (New York / Carlstadt, NJ)

Cost: approximately **\$8.08/month** on a 24-month term (\$5.28 base + \$2.80 US East location fee).

Notes: - Contabo provisioning can take several hours on first order. - There is no hourly billing — the server is billed monthly once created. - Support is email-only.

What to send back

After the server is provisioned, Contabo will email you the **IP address** and the **root password**. Forward these to the team lead via **Outlook email**.

Specifically:

1. Server IP address
2. Root password
3. Confirmation that the operating system is Ubuntu 22.04

Once we have those, we will handle everything else.

What this server is for (context only — no action needed)

It hosts a Docker container that connects to MetaTrader brokers. Our trading worker (running on Railway) sends requests to this server, which talks to the broker and returns the results.

Why US East (Carlstadt, NJ): It is roughly 5 ms from New York City and about 15 ms from the New York broker servers we connect to. Latency matters for trade execution.

Why 4 vCPU / 8 GB: Each MetaTrader session uses roughly 35 MB of RAM (measured). 8 GB handles around 160 concurrent sessions. We will monitor usage and upgrade the plan if needed — Contabo plans can be upgraded in place without rebuilding the server.
